

# NOTES

## PLATELET DISORDERS

### GENERALLY, WHAT ARE THEY?

#### PATHOLOGY & CAUSES

- Platelet dysfunction, impaired hemostasis, bleeding

#### RISK FACTORS

- Children of parents who are close relatives (consanguineous)

#### COMPLICATIONS

- Mild to severe hemorrhage

#### SIGNS & SYMPTOMS

- Mucocutaneous bleeding
- Excessive bruising/bleeding after minor trauma
- Immediate, excessive bleeding with invasive procedures

#### DIAGNOSIS

##### LAB RESULTS

- Complete blood count (CBC)
- Clotting studies (e.g. bleeding time)
- Platelet function tests

#### TREATMENT

- Manage spontaneous/trauma-related bleeding episodes

##### MEDICATIONS

- Anti-fibrinolytic therapy
- Platelet transfusions
- Avoid antiplatelet medications
- Corticosteroids, immunosuppressants

## BERNARD-SOULIER SYNDROME (BSS)

[osms.it/bernard-soulier-syndrome](https://osms.it/bernard-soulier-syndrome)

#### PATHOLOGY & CAUSES

- Rare, inherited clotting disorder; mild **thrombocytopenia**, **macrothrombocytopenia** (giant platelets), platelet dysfunction, bleeding

#### CAUSES

- Autosomal recessive inheritance pattern

- Platelets lack essential glycoprotein Ib-IX-V complex (GPIb) → impaired hemostasis → bleeding

#### RISK FACTORS

- Prevalence in individuals of Mediterranean descent
- Children of parents who are close relatives (consanguineous)

## SIGNS & SYMPTOMS

- Mucocutaneous bleeding
  - Epistaxis; gingival bleeding; petechiae, purpura (coalesced petechiae); GI bleeding; genitourinary bleeding (e.g. hematuria); menorrhagia
- Excessive bruising/bleeding after minor trauma; bruises linger
- Immediate, excessive bleeding with invasive procedures
- Asymptomatic until adulthood

## DIAGNOSIS

### LAB RESULTS

- CBC
  - Low platelet count
- Peripheral blood smear analysis
  - Giant platelets (accelerated platelet turnover)

- Clotting studies
  - Bleeding time **prolonged** (PT, aPTT normal)
- Flow cytometry
  - Deficient/absent GPIb-IX-V complex

## OTHER DIAGNOSTICS

- Physical examination
  - Purpura
  - Ecchymoses

## TREATMENT

### MEDICATIONS

- Avoid antiplatelet medications
- Anti-fibrinolytic therapy (e.g. tranexamic acid)

### OTHER INTERVENTIONS

- Platelet transfusions (e.g. prophylaxis before invasive procedures)
  - HLA matching/leukocyte reduced platelets reduces risk of allo-antibody formation

# GLANZMANN'S THROMBASTHENIA (GT)

[osms.it/glanzmanns-thrombasthenia](https://osms.it/glanzmanns-thrombasthenia)

## PATHOLOGY & CAUSES

- Inherited bleeding disorder, **defect** in platelet surface receptor  $\alpha_{IIb}\beta_3$
- Platelet-mediated hemostasis
  - Binding of platelets to exposed components of **injured endothelium** through glycoprotein (GP) receptors on platelet surface (e.g. GPIb/IX, GPIIb/IIIa, integrin  $\alpha_{IIb}\beta_3$ )
- Integrin  $\alpha_{IIb}\beta_3$  defect → impaired platelet clot retraction, altered hemostasis

## CAUSES

- Autosomal recessive inheritance pattern
- Rarely, allo-/auto-antibodies to platelet  $\alpha_{IIb}\beta_3$  produced by autoimmune conditions (e.g. systemic lupus erythematosus, immune thrombocytopenia, myelodysplastic syndrome) during pregnancy/with use of platelet integrin  $\alpha_{IIb}\beta_3$  antagonists (abciximab, eptifibatide)

## RISK FACTORS

- Slightly more common in individuals who are biologically female
- Children of parents who are close relatives

- Conditions requiring frequent platelet transfusion
  - Platelet alloimmunization

## COMPLICATIONS

- Fatal bleeding
  - Risk increases during childbirth (maternofetal bleeding, primary/secondary postpartum hemorrhage)

## SIGNS & SYMPTOMS

- Mucocutaneous bleeding
  - Epistaxis; gingival bleeding; petechiae, purpura (coalesced petechiae); gastrointestinal (GI) bleeding; genitourinary bleeding (e.g. hematuria); menorrhagia
- Excessive bruising/bleeding after minor trauma
- Immediate, excessive bleeding with invasive procedures
- Infants
  - Leukocytosis, delayed separation of umbilical cord, purpura, spontaneous bruising, mucocutaneous bleeding

## DIAGNOSIS

### LAB RESULTS

- CBC
  - Platelet count normal
- Clotting studies
  - Bleeding time prolonged (PT, aPTT normal)
- Light transmission aggregometry (LTA)
  - Determines degree of platelet aggregation
  - Decreased or absent in GT
- Platelet function analyzer (PFA)
  - Measures flow rate as platelets form platelet plug within capillary tube
  - Formation of platelet plug prolonged in GT

- Flow cytometry
  - Deficient/absent  $\alpha_{IIb}\beta_3$  platelet receptors
  - Mutation analysis through genomic DNA sequencing

## OTHER DIAGNOSTICS

- Physical examination
  - Purpura
  - Ecchymoses

## TREATMENT

- Avoid antiplatelet medications, punctures, invasive procedures

## MEDICATIONS

- Individuals who are biologically female, of childbearing age
  - **Menorrhagia**: oral contraceptives (suppress menstrual periods); iron supplementation; hysterectomy (if bleeding severe)
  - **Childbirth**: prophylaxis with recombinant factor VIIa + antifibrinolytic agent
- Rituximab, corticosteroids, immunosuppressants (e.g. cyclophosphamide)

## OTHER INTERVENTIONS

- Manage bleeding episodes
  - Compression, fibrin sealants, gelatin sponges, nasal packing, topical thrombin, anti-fibrinolytic therapy (e.g. tranexamic acid), recombinant factor VIIa
- Platelet transfusions (e.g. prophylaxis before invasive procedures)
  - HLA matching/administration of leukocyte reduced platelets reduces allo-antibody formation
- Oral hygiene mitigates gingival bleeding
- Hematopoietic cell transplantation (if bleeding severe, recurrent)
